

You are the captain of the starship Voyager, travelling through the vastness of space. As you navigate through a particularly dense asteroid field, your ship suddenly shakes violently and alarms start blaring. You quickly assess the situation and realize that your ship has been hit by a rogue asteroid and your engines are down. You are stranded and must find a way to repair your ship before your oxygen runs out. Option 1: Send a distress signal for help. Option 2: Try to repair the engines yourself. Option 3: Scavenge for parts on nearby asteroids.

You quickly send out a distress signal, hoping that someone nearby will receive it and come to your aid. As you wait, you monitor your ship's systems and try to conserve as much oxygen as possible. After several hours, you finally receive a response. A nearby space station has received your distress signal and is sending a repair team to your location. Option 1: Await the repair team's arrival. Option 2: Attempt to repair the ship while waiting. Option 3: Scavenge for additional resources to supplement the repair team's efforts.
