

You wake up in a cryogenic pod aboard a spaceship hurtling through space. You have no memory of how you got here or where you're going. As you slowly regain consciousness, you notice a control panel in front of you with a flashing red button. The label reads "Emergency Evacuation Pod". Option 1: Press the button and evacuate the spaceship. Option 2: Ignore the button and try to access the ship's database for information. Option 3: Check your surroundings and see if there's any immediate danger. Option 4: Try to open the pod and explore the ship.

You press the button and the emergency evacuation pod launches from the spaceship. As you drift through space, you notice a nearby planet that could potentially sustain life. However, you also notice that the pod's propulsion system is damaged and you won't be able to reach the planet safely without repairing it. Option 1: Use the onboard tools to repair the propulsion system. Option 2: Try to radio for help from any nearby ships or colonies. Option 3: Abandon the pod and attempt to drift towards the planet using the escape pod's emergency thrusters. Option 4: Wait for a potential rescue mission from your home planet or the nearest galactic outpost.
