

Image 1

You wake up from cryostasis and find yourself on a spaceship heading towards a distant planet. As the ship's AI system begins to boot up, you realize that there are several other cryopods on board. Suddenly, an alarm starts blaring and the AI system announces that there is a breach in the ship's hull.

Option 1: Try to find and repair the breach by yourself.

Option 2: Wake up the other passengers to help with the repair.

Option 3: Ignore the alarm and explore the ship.

Option 4: Use the ship's emergency escape pods and abandon the mission.

Image 2

You decide to wake up the other passengers to help with the repair. One by one, you bring them out of cryostasis and explain the situation. Once everyone is awake, you work together to locate the breach and repair it. It takes a few hours of hard work, but eventually, the ship is once again sealed from the vacuum of space.

Option 1: Continue the mission as planned.

Option 2: Investigate the cause of the breach to ensure it won't happen again.

Option 3: Go back into cryostasis and hope for a better outcome on the next awakening.

Image 3

You decide that the mission is too dangerous and uncertain to continue, so you and the others agree to go back into cryostasis and hope for a better outcome on the next awakening. As the medic puts you back into deep sleep, you can't shake the feeling that there was something important you were supposed to do out there in space.

The next time you wake up from cryostasis, you will have a chance to fulfill your mission and find out what really happened on that distant planet.
