

You are a crew member on a deep space exploration mission to the outer reaches of the galaxy. Your ship has just entered a strange cloud of gas that appears to be altering the sensors and navigation systems. Suddenly, your ship is hit by a burst of energy, and everything goes dark. As the emergency systems bring the ship back online, you realize that you are no longer in the same part of the galaxy. A nearby planet shows up on the sensors, and you must make a decision. Option 1: Investigate the planet Option 2: Try to repair the navigation system and find your way back to familiar territory.

You and several other crew members take the shuttle down to the planet's surface. As you descend, you notice that the planet appears to be completely uninhabited. The shuttle lands safely, and you exit the craft to explore the strange new world. After a few hours of exploration, the crew comes across a strange device emitting a pulsing beam of energy. Option 1: Take a closer look and try to study the device Option 2: Leave the device alone and continue exploring
